

SUMMARY

Catastrophe (cat) bond issuance started the year strongly. 2016 began with the highest Q1 issuance volume since the Authority began tracking the market in 2009. A total of ten bonds were issued in the amount of \$2.2 billion while 17 ILS deals matured with a notional value of \$2.1 billion. The net issuance of bonds increased the total stock of outstanding capacity to \$26.5 billion, an increase of 13.0% year over year.

Bermuda remains the leading jurisdiction for the issuance of cat bonds. ILS issued from Bermuda represents 69% (\$18.4 billion of \$26.5 billion) of total outstanding ILS capacity. Since 2010, Bermuda based SPIs have issued 125 ILS bonds while 159 SPIs have been registered.

Bermuda is also host to foreign ILS listings, which augment the depth of the secondary market.* There are 79 ILS deals (104 tranches) listed on the Bermuda Stock Exchange (BSX) with an aggregate nominal value of \$19.0 billion. Six new ILS deals were listed on the BSX during the quarter while nine matured.

Figure 1. Global Capacity Issued and Outstanding by Year (In US\$ bln)

Source: Swiss Re, Artemis, and Bermuda Monetary Authority (Authority) staff calculations.

* Notes programmes are excluded from the number of BSX listings. Moreover, the aggregate nominal value of listed ILS does not include ordinary shares issued by (re)insurance funds or participatory notes issued by sidecars.

PRIMARY MARKET: GLOBAL MARKET OVERVIEW

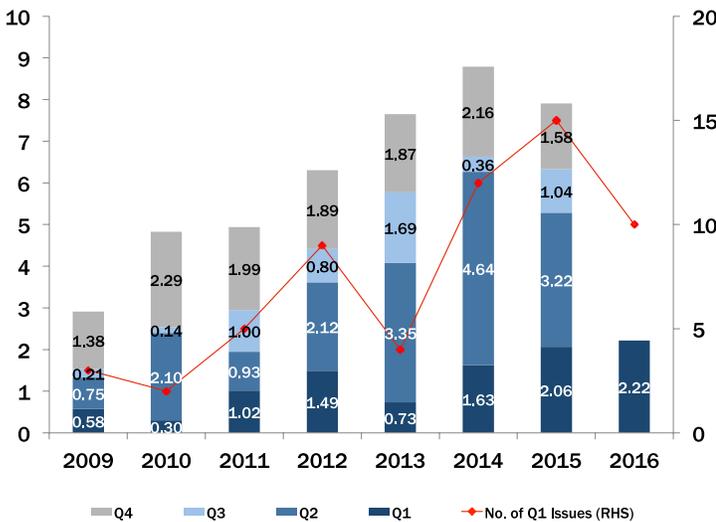

ILS deal volume in Q1-2016 reached a record level for first quarter issuances increasing 7.0% when compared to activity during the same period last year (Figure 2).¹ There were ten new bonds issued, totalling \$2.2 billion (15 deals; \$2.1 billion in Q1-2015). Over the same period, 17 ILS deals matured with a notional value of \$2.1 billion. The net issuance volume of bonds increased the total stock of outstanding capacity to \$26.5 billion. This represents an increase of 13.0% year-over-year.

The average deal size for Q1-2016 also reached a record level for first quarter transactions. The average deal size during the quarter was approximately \$222.0 million, up from \$138.0 million in the same quarter last year (Figure 3). There were four deals in the amount of \$300.0 million, two of which were issued by Bermuda-

domiciled SPIs, and one each out of Ireland and the Cayman Islands. At the lower end, there were two deals smaller than \$100.0 million, issued by vehicles in Bermuda and the Cayman Islands respectively.

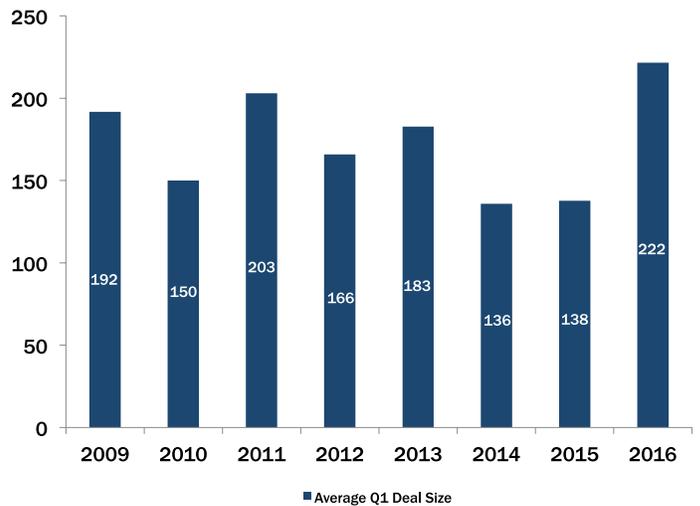

Indemnity triggers continue to account for over half of the outstanding volume of ILS deals. Insurance linked securities with an indemnity trigger represent 60.0% (\$15.8 billion of \$26.5 billion) of total outstanding volume of the ILS market. This is followed by the industry loss index trigger type which accounts for 23.0% of the outstanding volume (Table IV). During the quarter, 63.0% of the issued deal volume (\$1.4 billion of \$2.2 billion) used indemnity triggers while 27.0% used an industry loss index.

The ILS market remains small relative to traditional (re)insurance business (see tables above). The \$26.3 billion of risk covered by ILS represents 5.0% of global reinsurer capital, which is estimated to be \$565.0 billion.² Since Bermuda entered the market in 2009, 235 ILS bonds have been issued; there are currently 123 (84 Bermuda deals) outstanding bonds that have not matured. Bermuda maintained its position as the leading jurisdiction in the ILS industry over the past quarter accounting for 69% (\$18.4 billion of \$26.5 billion) of the outstanding volume in the market. Other countries with significant insurance securitisation activity in this area include the Cayman Islands and Ireland, which represent 20.0% and 9.0% respectively.

The majority of ILS covers North American perils, which account for

Figure 4. Total Outstanding Volume of ILS by Region/Peril, end Q1-2016 (In US\$ bln)

68.0% of total outstanding volume (Figures 4 and 5).³ Asian and European perils account for 10.0% and 9.0% of the market respectively, while the remaining categories account for approximately 13.0% of the market by volume. Primary insurers sponsored 63.0% of total coverage for North American perils (\$11.4 billion of \$18.1 billion). In contrast, the sponsor-type for half the volume for Asian bonds (\$1.3 billion of \$2.6 billion) falls under the other category. This includes government agencies and pooled associations/cooperatives. European perils account for 9.0% (or \$2.3 billion) of the market and the sponsor-type is fairly evenly distributed amongst insurers, reinsurers and entities which fall in the other category. Bond volume for the multi-regional bonds represents 7.0% (\$2.0 billion) of the overall ILS bond market while life and health securities account for the remaining 6.0% of the market (\$1.5 billion).

Figure 5. Coverage per Region/Peril by ILS Sponsor Type, 2009 to Q1-2016 (In %)

Source: Artemis and Authority staff calculations.

PRIMARY MARKET: DOMESTIC ISSUANCE

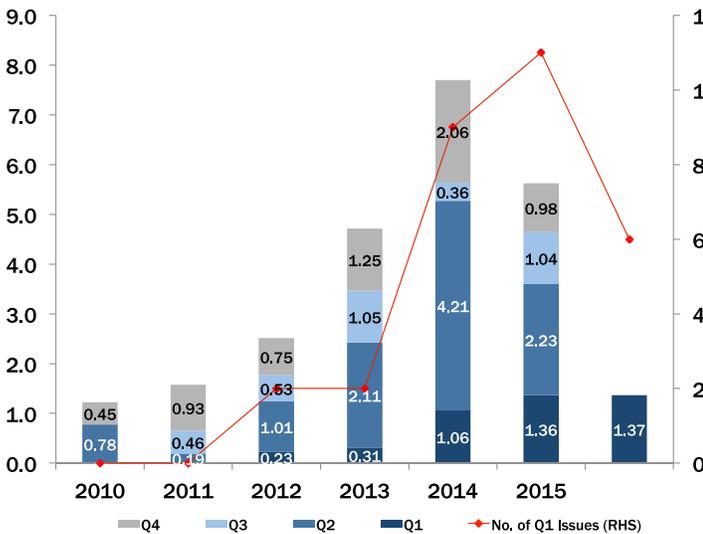

Bermuda maintained its leading position as the leading jurisdiction for the issuance of ILS. Bermuda-based SPIs accounted for 62.0% (\$1.4 billion of \$2.2 billion) of new issuance volume during the quarter. During the first quarter of the year, Bermuda-based SPIs underwrote \$1.2 billion of property and catastrophe (P&C) risks via six ILS transactions (Figure 6), covering North American, Asian and multi-regional perils. Overall, Bermuda-issued ILS represents 69.0% (\$18.4 billion of \$26.5 billion) of total outstanding capacity at the end of Q1-2016.

The average deal size for Bermuda-issued ILS in Q1-2016 was \$228.0 million, the highest on record since Bermuda entered the ILS space in 2010. This represents an increase of \$103.0 million per deal compared to the same quarter last year which recorded

an average volume of \$124.0 million (Figure 7). The two largest Bermuda-based deals during the quarter were issued by Merna Re Ltd. 2016-1 and Galileo Re Ltd. 2016-1 respectively, each in the amount of \$300.0 million.

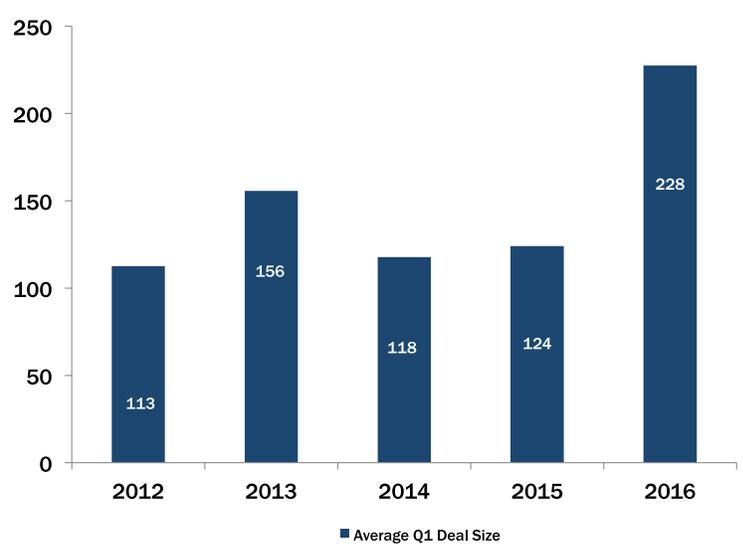

The BSX accounted for 72.0% of the global market capitalisation of Insurance-Linked Securities at the end of Q1-2016. A total of 79 ILS deals (comprising 104 tranches) are listed on the BSX with an aggregate nominal value of approximately \$19.0 billion,⁴ of which \$1.1 billion (6.0%) are issued by non-Bermuda entities, namely Ireland and the United States. Six (ten tranches) of the ten deals issued during the quarter were listed on the BSX, with a notional \$1.4 billion amount. Over the same period, nine deals (nine tranches) worth \$512.0 million matured.

Figure 6. Quarterly ILS Issuance by Volume (In US\$ bln) and Number of Q1 Deals - Bermuda only, 2010 to Q1-2016

Source: Artemis and Authority staff calculations.

Figure 7. Domestic Q1 ILS Issuance (Average Deal Volume), Q1-2012 to Q1-2016 (In US\$ mln)

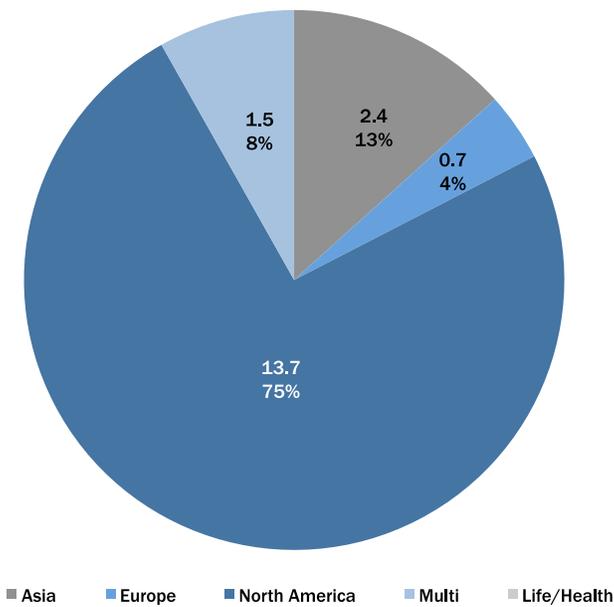

Source: Artemis and Authority staff calculations.

⁴ This does not include notes programmes, ordinary shares issued by (re)insurance funds and participating notes issued by sidecar vehicles.

The Bermuda market is a leader in the specialisation of cat bonds, with the majority of transactions based on indemnity triggers. Since the first Bermuda ILS deal was issued in 2010, an indemnity trigger has accounted for 64.0% (\$11.8 billion of \$18.4 billion) of outstanding deal volume for transactions issued by Bermuda-based SPIs. North American perils by direct underwriters claim the largest share of outstanding ILS (Figures 8 and 9). There is some global activity in life securitisation but domestic issuance is motivated by P&C underwriting, given the large footprint of the business line in Bermuda. This serves to

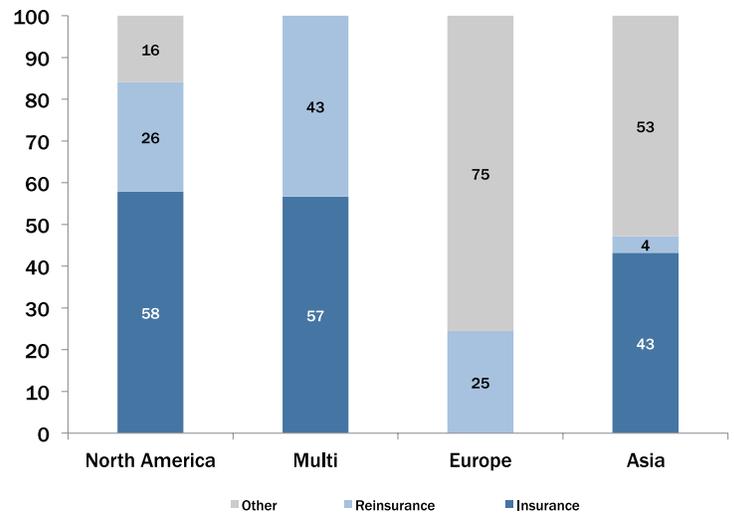

Figure 8. Total Outstanding Volume of Bermuda-issued Deals by Region/Peril, end Q1-2016 (In US\$ bin)

Source: Artemis and Authority staff calculations.

further explain the prevalence of non-parametric, indemnity-based ILS triggers. Primary insurers sponsored 58.0% of total coverage for those bonds (\$7.9 billion of \$13.7 billion). In contrast, reinsurers ceded 43.0% and 25.0% of multi-region and European risks, respectively. Other sponsor types (insurance pools/associations) ceded 75.0% and 53.0% of European and Asian risks, respectively (Figure 9). Tables I-IV provide a summary of ILS issuance by volume and number of deals in key jurisdictions, as well as the distribution of trigger types.

Figure 9. Percent of Coverage per Region/Peril by ILS Sponsor Type for Bermuda-issued Deals, 2010 to Q1-2016 (In %)

Source: Artemis and Authority staff calculations.

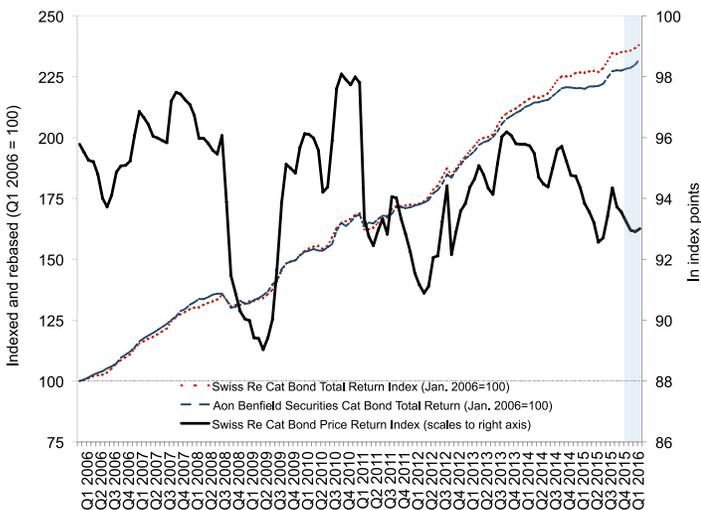

SECONDARY MARKET: PRICE INDICES

Given the large footprint of P&C insurance risk in the ILS market, this section reviews the overall market performance of outstanding cat bonds based on three of the most commonly used benchmark indices (Swiss Re Cat Bond Total Return Index, Aon Benfield Securities Cat Bond Total Return, Swiss Re Cat Bond Price Return Index).

The risk-return trade-off was more favourable amid significantly higher price returns and modestly higher volatility compared to the same quarter a year ago. Table V provides a summary of selected indicators of market performance over the last six quarters (Q4-2014 to Q1-2016) comparing the recent development of the Swiss Re Cat Bond Total Return Index and the Aon Benfield Securities Cat Bond Total Return Index as the global market benchmarks.⁵ During the first quarter, the two indices recorded a return of 0.4% (up from 0.1% during the previous quarter) and 0.6% (up from 0.1%). The annualised return volatility of each index was slightly lower than the previous quarter, down to 0.5% and 0.4% respectively during the quarter. Figure 10 shows

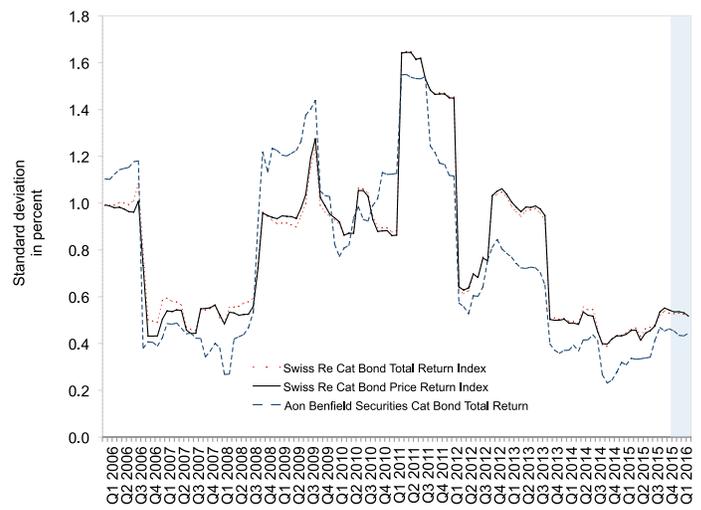

the quarterly closing levels of the two total return indices by Swiss Re and Aon Benfield, which illustrate the valuation gain of a broad Cat portfolio since Q1-2006 (as base year), and the corresponding price return index as suitable relative benchmarks to other investments. Figure 11 shows the normalised return volatility over a 12-month rolling window. Figure 10 reflects that while capital gains have been positive since 2006, prices at the end of Q1-2016 continued to persist beneath the peak levels achieved in early 2011, despite increasing for a second time over the past three quarters during Q1-2016. Figure 11 highlights that during the same time, the annualised return volatility (as a measure of risk) dropped significantly.

Source: Artemis and Authority staff calculations.

Figure 11. ILS Total Return and Price Return Benchmark Indices: Annualised Return Volatility, 2006-Q1 2016 (In %)

Source: Artemis and Authority staff calculations.

⁵ The Swiss Re indices were launched in June 2007 and comprise a series of performance indices constructed to track the price return and total rate of return of performance of all outstanding dollar-denominated cat bonds. The main index is divided into 18 different sub-indices, of which the most important ones are “Single-Peril US Wind cat Bonds”, “Single-Peril California Earthquake cat Bonds” and “BB cat Bonds” (Standard & Poor’s-rated). The index is based on Swiss Re pricing indications only and base-weighted back to January 2002. Three years after Swiss Re, Aon Benfield Securities, the securities and investment banking operation of Aon Benfield, launched its own ILS indices in 2010. These indices are base-weighted from December 2000 and track the performance of cat bonds in four different baskets: “All Bond”, “BB-rated Bond”, “US Hurricane Bond”, and “US Earthquake Bond”.

Table V. Selected ILS Market Performance Indicators, Q4-2014 to Q1-2016

BERMUDA: REGISTRATION OF SPECIAL PURPOSE INSURERS (SPIs) AND NUMBER OF ILS ISSUED

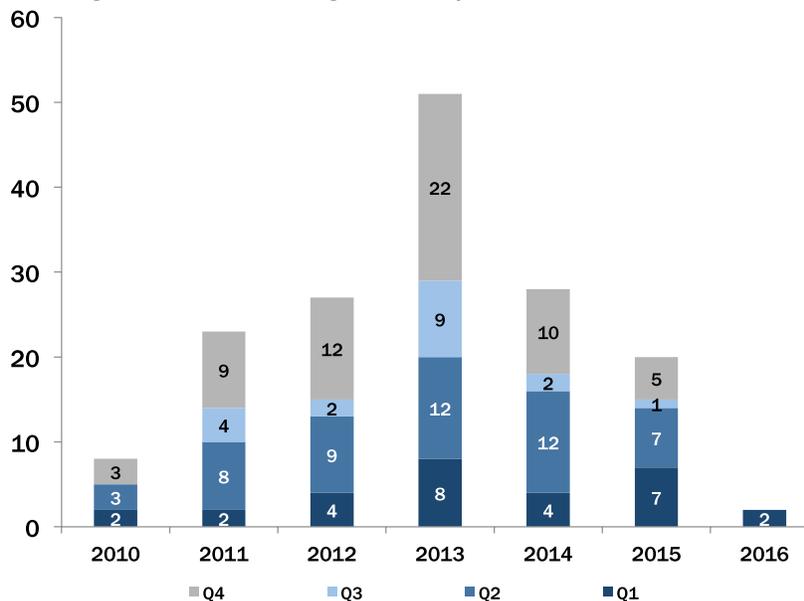

The number of SPI registrations during the quarter declined year-over-year. The BMA licensed five SPIs during Q1-2016 compared to 10 registrations during the same period last year (Figure 12).

BERMUDA: STRUCTURAL FACTORS AND SUPERVISORY REGIME

A sophisticated legal system, a strong regulatory framework, a developed infrastructure as well as the local availability of highly-skilled human capital underpin Bermuda's reputation as a quality jurisdiction and domicile of choice for insurance, reinsurance and financial services' companies. Bermuda is known for its innovative (re)insurance industry, which has shown resilience during the financial crisis.

Bermuda has emerged as a leader in the global ILS market only four years after implementing a specific regulatory framework to facilitate the formation of such instruments through a new

licence class for insurers. In 2009, the Bermuda Monetary Authority introduced the concept of a Special Purpose Insurer (SPI), following passage of the Insurance Amendment Act 2008. Bermuda's regulatory and supervisory framework also provides for the creation of sidecars, Industry Loss Warranties (ILWs), and collateralised reinsurance vehicles. The ILS market has benefitted from a large investor base and the existing (re)insurance expertise in Bermuda, which hosts one of the world's largest reinsurance markets with some 1,400 firms and total assets of more than \$500.0 billion at end-2012.

BOX 1: REGULATORY FRAMEWORK FOR ILS IN BERMUDA

The following information provides a brief overview of the legislation governing the process of forming SPIs as issuers of ILS in Bermuda.⁶ For this purpose, SPIs are structured as “bankruptcy remote” entities, which are required to be fully-funded and independent companies that accept pre-specified insurance risk from, and which are managed by, a sponsoring (re)insurance company.⁷ The regulatory focus during the licensing process of SPIs is on the assessment of the quality of the sponsoring entity and the complete collateralisation of the policy limits of insurance risk ceded to the SPI. Moreover, investments in SPIs are restricted to sophisticated participants.

The characteristics of collateralisation and investor eligibility are defined in the *BMA Guidance Note No. 20 – Special Purpose Insurers*.⁸

Collateralisation — To be fully collateralised, an SPI will be expected to: (i) confirm full disclosure to the cedant or insured of the fact that the maximum reinsurance recovery from the SPI is limited to the lower of the stated contract limit or the available assets of the SPI; (ii) ensure that, under the terms of any debt issue or other financing mechanism used to fund its (re)insurance liabilities, the rights of providers of that debt or other financing are fully subordinated to the claims of creditors under its contracts of (re)insurance; (iii) enter into contracts or otherwise assume obligations which are solely necessary for it to give effect to the (re)insurance special purpose for which it has been established; and (iv) ensure that, to the extent that more than one (re)insurance contract is in place within the SPI, each of the (re)insurance contracts is structured so that the SPI meets the fully collateralised requirements individually for each contract.

Sophisticated Investors — Sufficiently sophisticated participants [for the purposes of SPI licensing] satisfy one or more of the criterion below: (i) high income private investors; (ii) high net worth private investors; (iii) sophisticated private investors; (iv) investment funds approved by the Authority under the Investment Funds Act (IFA); (v) bodies corporate, each of which has total assets of not less than \$5 million, where such assets are held solely by the body corporate or held partly by the body corporate and partly by one or more members of a group of which it is a member; (vi) unincorporated associations, partnerships or trusts, each of which has total assets of not less than five million dollars, where such assets are held solely by such association, partnership or trust or held partly by it and partly by one or more members of a group of which it is a member; (vii) corporate bodies, all of whose shareholders fall within categories (i)-(iii); (viii) partnerships, all of whose members fall within categories (i)-(iii); (ix) trusts, all of whose beneficiaries fall within categories (i)-(iii); (x) any company quoted on a recognised stock exchange; and (xi) any party deemed to have sufficient knowledge and experience in financial and business matters to make them capable of evaluating the merits and risks of the prospective investment.

Incorporation and Registration Process — The process of establishing an SPI is substantially similar to that for “conventional” commercial and captive insurers. Key elements of the “Licensing Application” include: (i) a business plan, which provides the fundamental elements of the proposed transaction and, importantly, evidences the fully collateralised and sophisticated nature of the business; (ii) a completed “SPI Checklist” (a standard BMA form); (iii) drafts of relevant transaction documents (such as reinsurance agreements, collateral trust agreements, etc.); and (iv) service provider acceptance letters.

⁶ The material presented is not intended to be a substitute for professional legal advice.

⁷ Prior to the SPI legislation, ILS were not listed in Bermuda.

⁸ Full details of the relevant legislative provisions and supervisory guidance for SPIs may be found at <http://www.bermulaweb.com/Laws/Consolidated%20Laws/Insurance%20Act%201978.pdf> and <http://www.bma.bm/document-centre/policy-and-guidance/INSURANCE%20II/Guidance%20Note%20No.%2020%20-%20Special%20Purpose%20Insurers.pdf>.

APPENDIX

BACKGROUND: THE EVOLUTION OF INSURANCE-LINKED SECURITIES (ILS)

The emergence of ILS has been one of the most significant developments in the (re)insurance sector during recent years.

These securities are products of the convergence between the insurance and capital markets and may be used in addition, or as an alternative to the purchase of reinsurance. More specifically, ILS structures represent Alternative Risk Transfer (ART) instruments that enable insurance risk to be sold in capital markets, raising funds that can be used by issuers to pay claims arising from catastrophes and other loss events. The most prominent type of ILS are CAT bonds, which are fully collateralised debt instruments that pay off on the occurrence of defined catastrophic events. Although the ILS market is small relative to the overall (re)insurance market, it is significant when compared to the P&C sector of the traditional (re)insurance market.

Insurance securitisation increased from near zero in 1997 to about \$15.0 billion in 2007 before falling sharply due to the financial crisis and a lack of investor appetite for life insurance transactions “wrapped” with monoline insurer guarantees.⁹

Until 2007, ILS issuance was largely motivated by long-term business (i.e., life insurance) as a result of Regulation XXX and capital management objectives.¹⁰ Since Regulation XXX securitisation depended on monoline wraps to achieve the “AAA” ratings required by investors, the financial challenges of monoline insurers have inhibited any significant growth in this segment of the ILS market since 2007. Natural catastrophe risk securitisation through CAT bonds also formed a key segment of the market and represented almost half of the ILS market when it peaked in 2007 at approximately \$7.0 billion.¹¹ However, as with the life-related securitisation transactions, issuance dropped in early 2008 due to a surplus of traditional (re)insurance capacity, and dried up completely after the collapse of Lehman Brothers whose credit derivative contracts backed low-quality collateral underlying some of the transactions.¹² When these bonds were sharply downgraded, investors stepped back on fears that other CAT bonds were similarly exposed to credit risk.

Shortly after the height of the financial crisis, in February 2009, ILS issuance began to recover as issuers introduced more conservative collateralisation procedures and reinsurance markets tightened.

Since then issuance volumes have steadily grown. If the trend continues it may not be long before the 2007 record issuance is surpassed. Outstanding natural ILS and sidecars peaked at just under \$16.0 billion at end-2007 (Goldman Sachs, 2011). In comparison, global-insured CAT losses were about \$40.0 billion in 2010, and ranged from \$10.0 billion to \$30.0 billion between 1990 and 2009 (indexed to 2010 US dollars), except for 2006, which spiked to over \$100.0 billion (Swiss Re, 2011).

In 2012, the global ILS market continued to expand and amounted to more than \$16.0 billion (up from \$13.8 billion in 2011), with an overall market capitalisation of almost \$6.0 billion.

After relatively limited growth between 2010 and 2011, primary market activity picked up significantly in 2012 in spite of several natural disasters, including Superstorm Sandy in the US. Most of the recent issuance of ILS was motivated by the current economic conditions, which have allowed the cost-efficient structure of these instruments to benefit from low risk premia, which lowered the cost of capital.

⁹ However, such transactions were more about regulatory arbitrage than actual risk transfer. Note that the present data do not include “life settlement” transactions (where whole life insurance policies are sold by the beneficiary or insured for an amount greater than its surrender value, but lower than the policy’s face or insured value).

¹⁰ The National Association of Insurance Commissioners’ (NAIC) Model Regulation XXX requires insurers to establish heightened statutory reserves for term life insurance policies with long-term premium guarantees.

¹¹ Cat bonds were first created in the mid-to-late 1990s in response to a severe property catastrophe insurance crisis in the US caused by Hurricane Andrew (1992, Florida and Louisiana) and the Northridge Earthquake (1994, California).

¹² For a typical cat bond, issuance proceeds are invested in collateral to ensure that all interest, principal, and cat-contingent payments can be made in a timely manner. The issuers of the four bonds in question opted to hold lower-quality collateral coupled with a total return swap with Lehman Brothers to protect against any collateral deterioration.

APPENDIX continued

BACKGROUND: BENEFITS AND DRAWBACKS OF ILS

Benefits	
Ability to lock in multi-year protection	Multi-year capacity and pricing shelter the sponsor from cyclical price fluctuations in the reinsurance market (Note: traditional reinsurance contracts usually cover a one-year period while maturities for ILS are typically three to five years).
Trigger familiarity	The administration of an indemnity-based ILS reinsurance agreement is less complicated than that of a portfolio of complex reinsurance contracts.
Reduced transaction costs	ILS imply economies of scale while offering the tax and accounting benefits associated with traditional reinsurance. Many ILS are issued as part of a bond series, meaning that the majority of the documentation and structure may be used for a successor bond with relatively modest
Complementarity	ILS provide alternative options to traditional reinsurance diversify sources of capacity.
Collateralised coverage	ILS are fully collateralised risk-transfer facilities and prevent the cedant from losing reinsurance in the event of insolvency, negating concerns about counterparty credit risk.
"Pure play" investment risk	ILS isolate general business, credit-rating risks, and insolvency risks of the sponsor.
Diversification	ILS have low correlations to traditional asset classes, high risk adjusted returns, low volatility compared to other asset classes and strong collateral structures.
Drawbacks	
Capital market sensitivity	ILS issuance is highly dependent on capital market demand and liquidity.
Lower solvency buffers	ILS increase the possibility of transferring risks from the liability side onto the asset side of the balance sheet, thereby lowering solvency buffers.
Fixed up-front costs	ILS typically have fixed up-front costs that can include legal fees, modelling costs, brokerage fees, ratings fees and bank fees. All of these can be cost intensive for small issuers.
Basis risk	ILS with parametric triggers could imply "basis risk", which can be understood as the difference between the actual losses experienced by the sponsor and the payment received by the sponsor based on the design of underlying model and trigger structure. The basis risk from the model risk, trigger error or both would need to be evaluated by investor(s).
Competition for traditional reinsurance	ILS might drive traditional business away from reinsurers and lower premiums for traditional underwriting.
Regulatory arbitrage	ILS increase the possibilities of regulatory arbitrage; repackaging of transferred portfolios further weakens market transparency.
More complex supervision required	ILS introduces additional prudential considerations (e.g., security design, investment risks, and collateralisation) and therefore leads to more complex supervision (demands for integrated supervision).

APPENDIX continued

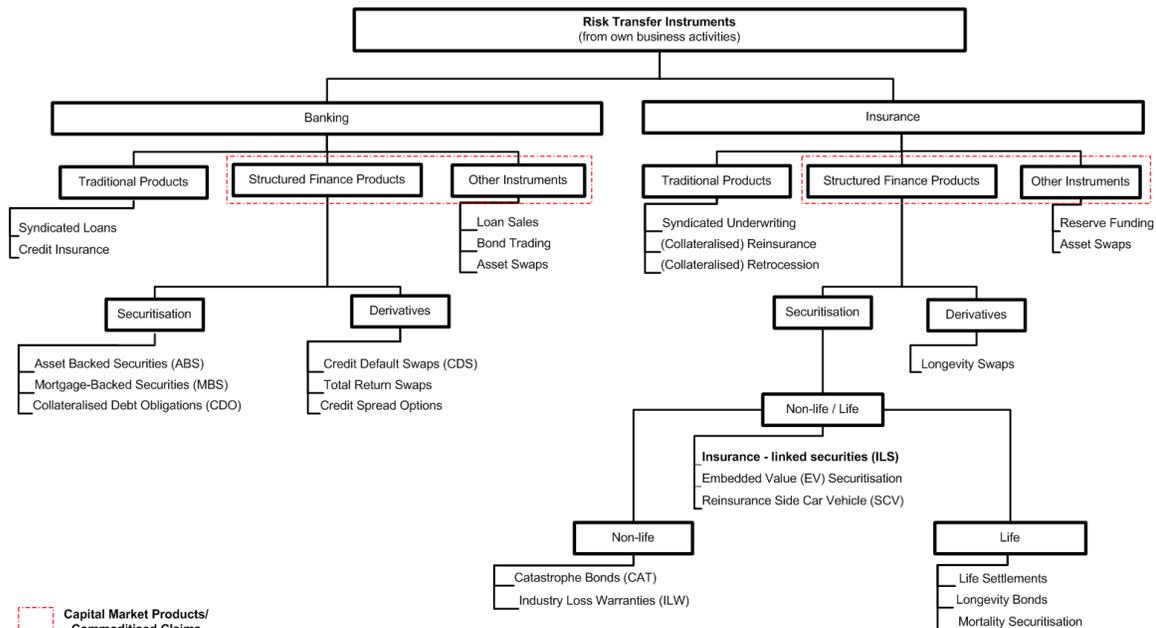

BACKGROUND: RISK TRANSFER IN STRUCTURED FINANCE AND INSURANCE SECURITISATION

Insurance-linked securities (ILS) securitise insurance risk as a form of capital market-based structured finance within the broad spectrum of risk transfer techniques (Figure 13). Opportunities for structured finance arise if (i) established forms of external finance are unavailable (or depleted) for a particular financing need, or

(ii) traditional sources of funds are too expensive for issuers to mobilise sufficient funds for what would otherwise be an unattractive investment based on the issuer's desired cost of capital. In general, structured finance comprises:

“All advanced private and public financial arrangements that serve to efficiently refinance and hedge any profitable economic activity beyond the scope of conventional forms of on-balance sheet securities (debt, bonds, equity) at lower capital cost and agency costs from market impediments and liquidity constraints. In particular, most structured investments (i) combine traditional asset classes with contingent claims, such as risk transfer derivatives and/or derivative claims on commodities, currencies or receivables from other reference assets, or (ii) replicate traditional asset classes through synthetic or new financial instruments.” (Jobst, 2007, pp. 200f)

Figure 13. Risk Transfer Instruments and Insurance Securitisation

Source: Authority and Jobst (2007)

Insurance securitisation is distinct from asset securitisation, which is commonly used by credit institutions and corporates.

Insurance securitisation by means of ILS represents an alternative, capital market-based source of funding profitable underwriting activities in lieu of raising capital from shareholders and borrowing from creditors (since reserves remain unchanged). The transfer of clearly defined insurance risk enables sponsors of ILS to benefit from more cost-efficient terms of funding without increasing their on-balance sheet liabilities or changing their underwriting capacity. Even though insurance securitisation shares with asset securitisation the premise of cost-efficient funding of diversified risk exposures and the reduction of the economic cost of capital, it is predicated on the creation of reinsurance recoverables in return for a pre-specified payment to investors, whose investment represents the collateralisation of the transferred insurance risk (up to the contractual policy limit).¹³ In contrast, asset securitisation describes the process and the result of converting (or “monetising”) cash flows

from a designated asset portfolio into tradable liability and equity obligations, which represents an effective method of redistributing asset risks to investors and broader capital markets (transformation and fragmentation of asset exposures).¹⁴

Insurance securitisation, much like structured finance in general, offers issuers enormous flexibility to create securities with distinct risk-return profiles in terms of maturity structure, security design and the type of underlying insurance risk. However, the increasing complexity of insurance securitisation, with a multiplicity of valuation models, loss triggers and pricing mechanisms, and the ever-growing range of products being made available to investors invariably create challenges in terms of efficient management and dissemination of information. Securitisation also involves a complex structured finance technology, which necessitates significant initial investment of managerial and financial resources.

¹³ Moreover, some of the characteristics of asset securitisation that contributed to the financial crisis between 2008 and 2011, such as insufficient screening of creditors, incentive problems of both sponsors and servicers in monitoring securitised loans, and the erroneous valuation models do not apply to insurance securitisation. For instance, in most cases sponsor retain loss provisions for insurance risk ceded to ILS structures, which provides incentives for the adequate actuarial assessment of underwriting risks.

¹⁴ Embedded Value (EV) securitisation is the only form of structured finance used by insurance firms that comes close to the concept of asset securitisation. EV securitisation transactions commoditise future cash flows that are released from a block of in force insurance business, future underwriting margins, investment income on reserves and required capital supporting the business, and anticipated reserve releases. By executing such a transaction, an insurer is able to receive an upfront payment using these future cash flows as collateral.

APPENDIX continued

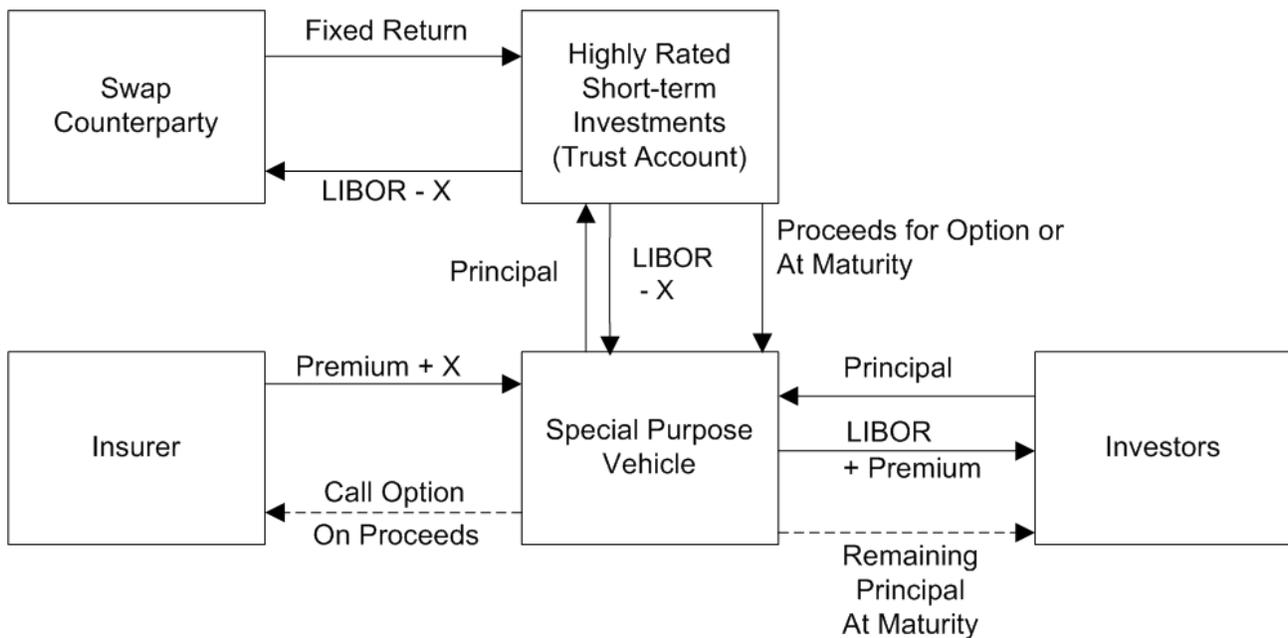

BACKGROUND: ILS STRUCTURE AND SECURITY DESIGN

A typical ILS transaction begins with the formation of a special purpose vehicle (SPV) or special purpose entity (SPE) subject to the registration and licensing by a regulatory authority (Figure 14). The SPV issues bonds to investors and invests the proceeds in safe, short-term securities such as government bonds or highly-rated corporates, which are held in a trust account. Embedded in the bonds is a call option that is triggered by a defined loss event. On the occurrence of the event, proceeds are released from the SPV to help the insurer pay claims arising from the event. For most ILS, the principal is fully at risk, i.e., if the contingent event is sufficiently large, the investors could lose the entire principal in the SPV. In return for the option, the insurer pays a premium to the investors. The fixed returns on the securities held in the trust are usually swapped for floating returns based on LIBOR (London Interbank Offered Rate) or some other widely accepted money market rate. The reason for the swap is to immunise the insurer and the investors from the variability of interest rates. Consequently, the investors receive LIBOR plus the risk premium in return for providing capital

to the trust. If no contingent event occurs during the term of the issued bonds, the principal amount is returned to the investors upon the expiration of the bonds.

In the absence of a traded underlying asset, ILS are structured to pay off on several types of triggering variables: (i) *indemnity triggers*, where pay-outs are based on the size of the sponsoring insurer's actual losses; (ii) *index triggers*, where pay-outs are based on an index not directly tied to the sponsoring firm's losses; (iii) *parametric triggers*, based on the physical characteristics of the event; (iv) *modelled loss triggers*, based on the results of a simulation model; or (v) *hybrid triggers*, which blend more than one trigger in a single bond (Cummins, 2012).¹⁵ If a trigger event occurs, it can result in an unwinding of the transaction or a haircut to the investor. To date, indemnity and industry loss index triggers have been most prevalent, accounting for approximately 75.0% of all deals issued since 2009.

Figure 14. Typical Structure of an Insurance-Linked Security (ILS).

Note: ILS structures have become more sophisticated as the market has grown in complexity with multiple perils as securitised risk and tranche subordination becoming more frequent. The illustration above represents a stylised version of an ILS structure.

15 A more comprehensive definition of each trigger type can be found on the next page.

GLOSSARY

TRIGGER DEFINITIONS

Indemnity refers to when the triggering event is the actual loss incurred by the sponsor following the occurrence of a specific event, in a specified region and for a specified line of business, as if traditional catastrophe reinsurance had been purchased. If the layer specified in the CAT bond is \$100 million excess of \$500 million, and the total claims add up to more than \$500 million, then the bond is triggered.

Industry Loss Index is a “pooled indemnity” solution where the indemnity loss experience of a number of companies is used to determine the industry loss estimate. The bond is triggered when the industry loss from a certain peril reaches the specified threshold, typically determined by a recognised agency.

Hybrid triggers combine two or more triggers in a single bond.

Modelled Loss structures refer to the construction of an exposure portfolio using modelling software. Once an event occurs, the event parameters are run against the exposure database. The structure is triggered if modelled losses exceed a specified threshold.

Parametric refers to those transactions that depend on the physical characteristics of a catastrophic event in order for the bond to be triggered. That is, the bond is triggered when the characteristics of the catastrophic event meet pre-specified conditions. Typical parameters include magnitude, proximity, wind-speed or whatever else is deemed appropriate for the given peril.

GENERAL TERMS

Alternative Risk Transfer (ART) refers to non-traditional forms of insurance and reinsurance as risk is transferred to other entities/business models or capital market investors as alternative providers of risk protection. Examples of the former include, for instance, self-insurance, captives, pools and risk retention groups, whereas insurance-linked securities (ILS) and industry loss warranties (ILWs) are examples of the latter.

Asset-Backed Security (ABS) is a security that is collateralised by the cash flows from a pool of underlying assets such as loans, mortgages, leases and receivables.

Basis Risk is the difference between the actual losses experienced by the sponsor and the payment received by the sponsor based on the design of underlying model and trigger structure when ILS use parametric triggers.

Catastrophe Bond is a risk-linked security that transfers a specified set of risks from the cedant or sponsor to investors in the capital market in order to provide cover for potential losses caused by catastrophic events.

Capital Market is a market in which individuals and institutions trade financial securities. Organisations/ institutions in the public and private sectors also often sell securities on the capital markets in order to raise funds.

Cedant refers to an insurance company purchasing reinsurance cover. In the context of ILS, a cedant can be an insurer or reinsurer as the added cover is provided by the capital market.

Counterparty Risk is the risk faced by one party in a contract that the other, the counterparty, will fail to meet its obligations under the contract. In most financial contracts, counterparty risk is also known as “default risk” or “credit risk.”

Credit Rating is a measure of risk that the payment terms agreed to by an entity or contained in a financial instrument will not be fulfilled. The rating is typically expressed as a letter grade issued by private sector credit rating agencies.

Diversification is a risk management technique that mixes a wide variety of investments within a portfolio to lower its level of risk as positive performance of some investments will offset to some extent the negative performance of others.

Event Risk is the insurable risk from an occurrence such as a catastrophe

Insurance-Linked Security (ILS) is a financial instrument through which insurance risk is transferred to capital markets and whose value is determined by insurance loss events.

Longevity Bond is a bond that pays a coupon proportional to the number of survivors in a selected birth cohort, creating an effective hedge against longevity risk.

Longevity Risk is the risk that people live longer than expected and life insurers will be exposed to higher than expected pay-out ratios.

Mean-Variance Efficient Frontier is a set of points showing the minimum return volatilities of portfolios for any given level of expected returns of portfolios.

Moral Hazard is a condition in which an individual or institution will tend to act less carefully than it otherwise would because the consequences of a bad outcome will be largely shifted to another party.

Peril refers to a specific risk or cause of loss covered by an insurance policy or insurance-linked security such as a catastrophe bond.

Premium is the specified amount of payment required by an insurer to provide coverage under a given plan for a defined period of time.

Primary Insurer is the insurer that cedes risk to a reinsurer.

Principal is the original amount invested, separate from any interest payments.

Regulatory Arbitrage refers to taking advantage of differences in regulatory capital requirements of financial activities across countries or different financial sectors, which might also involve differences between economic risk and that measured by regulatory standards.

Reinsurance defines the practice of insurers transferring portions of risk portfolios to other parties by some form of agreement in order to reduce the likelihood of having to pay a large obligation resulting from an insurance claim.

Securitisation is the creation of securities from a reference portfolio of pre-existing assets or future receivables that are placed under the legal control of investors through a special intermediary created for this purpose (SPI or SPV).

Special Purpose Insurer, Vehicle or Entity (SPI, SPV or SPE) assumes (re) insurance risks and typically fully funds its exposure to such risks through a debt issuance or some other financing.

Tranches of Securities represent a hierarchy of payment and risk typically associated with an asset-backed security. Higher tranches are less risky and have first priority on the payment of claims.

Trigger Type refers to how the principal impairment is triggered. The most common trigger types for ILS market structures include indemnity, industry loss index, modelled loss and parametric.

Underwriting Capacity is the maximum amount of money an insurer is willing to risk in a single loss event on a single risk or in a single period.
